MAGMA HPDC 6.0

Autonomous Engineering

High Pressure Die Casting

Robust, Economical, Fast, **Optimized**

Optimize all aspects of die casting production and find the best solution for your requirements — with MAGMASOFT[®] autonomous engineering.

MAGMASOFT[®] is the comprehensive and powerful simulation software for all aspects around designing and improving die casting quality, tooling design and robust process conditions while ensuring optimal profitability. The focus is on your resources, time and costs.

With MAGMASOFT[®], you use simulations in an automated virtual design of experiments or genetic optimization. The result is Autonomous Engineering – systematic and fully automated decision-making for tooling design and die casting production conditions.

With Autonomous Engineering, you can simultaneously pursue different quality and cost objectives. From securing part quality and process robustness at the concept stage, through final tooling design and the continuous improvement of profitability in series production. MAGMASOFT[®] autonomous engineering:

- Supports you in the comprehensive prediction of all process steps in cold and hot chamber die casting applications.
- Offers you a virtual test environment for the reduction of casting defects.
- Allows faster decision-making, saving time for all parties involved.
- Empowers preventive quality management through detailed understanding of process variations.
- Improves communication and cooperation both within your organization and with customers.

Targeted And Systematic Success

The MAGMA APPROACH, which is fully integrated in MAGMASOFT[®], is a systematic methodology for achieving your objectives using virtual experiments. In combination with MAGMASOFT[®] autonomous engineering, secured actions can be identified and implemented to achieve continuous improvements, without economic risks. The MAGMA APPROACH supports you at every stage of the product development or improvement process, through a systematic methodology. The result is a robust casting process that is optimally designed for the desired objectives and that enables stable production conditions taking into account alloy chemistry, melting practice and metallurgy.

Set Your **Objectives**, Define Your **Variables**, Specify Your **Criteria**

Die casting today demands maximum robustness and efficiency at an early stage of the process. With MAGMASOFT[®] autonomous engineering, simulations with different quality and

Die Preparation

Analyze the influence of spraying on part quality, distortion of castings and tool components, or local tool lifetime at any point in the development process.

MAGMASOFT[®] supports efficient tool and process development by three spray process scenarios.

cost targets can be carried out and evaluated automatically. The result is an optimally designed, robust process sequence to avoid casting defects, residual stresses and distortion.

- In the early product optimization phase with a simplified heat extraction from the cavity
- During the concrete process and tool design stage with any static or movable spray surfaces
- Up to the realistic simulation of the spray head with circuits, nozzles and the spray program for the detailed evaluation of the wetting of individual tool surfaces

Assisted Modeling

Spray surface

Versatile assistants and convenient CAD functions support you in targeted and effective model preparation and enable a short time to answer with minimum effort.

Assistant for casting layout design and preliminary calculation of machine parameters

Simulation of the dosing process into the shot chamber and considering the shot profile including plunger movement constitute the starting point for the die filling process. Create the shot chamber either based on a CAD import or as a parametric model in MAGMASOFT[®].

Analyze the system of shot chamber with dosing parameters, dwell times, variable plunger velocities and switchover points systematically.

Evaluate and optimize questions such as:

- How does the temperature loss of the melt influence the danger of cold shuts and oxide formation in the casting?
- What happens with air in the shot chamber?
- How is the casting quality affected by dosing variations?
- What are the optimum parameters for dosing, dwell time and shot profile for the chosen shot chamber?
- How does the shot chamber distort?

Analyze the filling process of the casting by considering the complete thermal balance in the die, the venting conditions, as well as the available machine capacity (PQ diagram).

Use MAGMASOFT[®] results such as flow vectors, flow velocities and tracer particles to design robust and economical gating systems.

Visualization of die filling

Optimize the casting quality regarding the danger of cold shuts or air entrapment and porosity with the help of automated parameter studies, from the variation of the plunger velocity up to the level of the intensification for time and pressure-dependent feeding.

Vacuum or local feeding through squeezing can also be used as optimization parameters.

Depending on the development phase, use appropriate settings to illustrate the thermal boundary conditions in the die.

Use the comprehensive MAGMASOFT[®] geometry database to quickly define simplified cooling elements.

Realistic representation of the thermal balance in the die

Tool and Process Design

The local thermal conditions in the die influence the solidification path in the casting.

Analyze in detail the local cooling capacity of the die cooling elements for any geometry (water lines, spot and conformal cooling) taking into account the inlet and outlet, the cooling medium, the temperatures and the flow rates.

Flow through cooling channels and calculation of local heating or cooling performance

Use the automated variation of cooling element geometry, position and process settings of the die thermal control system to improve casting quality, reduce cycle times, optimize the energy balance of individual cooling elements or the overall system, and reduce die stresses.

The visualization of the energy exchange between materials and material groups (energy balance) over the complete process, individual process phases or defined periods of time allows you to optimize your die casting process in terms of energy efficiency and profitability.

Detailed visualization of the energy balance for each process step and die section

Evaluate quality criteria such as macroporosity and microporosity, thickness of the pore free zone or die soldering tendency taking into account the cyclic temperature profile.

Prediction of critical die areas and their lifetime

Use the parametric variation of casting or tooling geometries integrated in MAGMASOFT[®], for example, to minimize die wear caused by erosion or cavitation.

The Robust Process

An early-stage virtual analysis of the effects of process fluctuations on quality, function and service life of the product avoids time-consuming and cost-intensive testing on the machine.

MAGMASOFT[®] autonomous engineering shows you the critical process parameters that lead you from the initial design idea through to a robust start of production.

Main effect matrix visualizes relevant influencing variables on cast quality – virtually generated process knowledge at a glance, long before the first prototype is cast.

Von Mises stresses and resulting ejector force curve during casting ejection

Ejection

Calculate ejector forces throughout the ejection process based on local contact pressures between casting and die.

Analyze ejector forces as a function of the draft angle, start time and the duration of ejection.

Optimize the number and position of ejector pins or minimize casting deformation during ejection.

Improve the subsequent process sequence with respect to residual stresses and casting distortion.

Heat Treatment

The simulation of the heat treatment process is seamlessly integrated into the virtual die casting process sequence. Evaluate local, thermally driven residual stresses as well as casting distortion. Consider all process steps from heating, throughout solution treatment and quenching, to ageing and cooling to room temperature. Use this information for the precompensation of distortion in the shape of the casting cavities in your tooling.

Make use of predefined process conditions and typical quenching

media for optimizing the casting-specific heating sequence, the ideal solution treatment time and temperature, as well as the quenching behavior.

During solution treatment and ageing, both residual stress relaxation through creep and casting distortion due to the influence of gravity are considered.

Assess the extended process sequence after heat treatment, for example, by evaluating the deformation of the casting due to stress redistribution during machining. This allows you to construct robust heat treatment racks – long before real castings are available!

Work Efficiently and Systematically

Your time is limited! To achieve your goals, it is crucial to systematically and efficiently utilize all the available possibilities in MAGMASOFT®'s comprehensive toolbox.

Intuitive Process Control

Take advantage of the control of all relevant process steps for optimization of the die casting cycle. Starting from spraying, placing of inserts and dosing times, through the opening sequence of the sliders, to handling times during ejection and guenching of the component.

Act & Check Your Improvements

Success is more than software and hardware. MAGMA's professional team is ready to comprehensively support you in realizing your goals. You can take advantage of the services of our MAGMAacademy, engineering and support teams when and how it suits you, and all from a single source.

All MAGMASOFT® programs are more than just software. They offer a methodology for optimizing engineering, communication and profitability in your organization.

Even before starting with our software, we will take the time to discuss with you the most important factors to ensure an effective and secured use of our tools based on your situation: from the required computer hardware through the qualification and training of users, to jointly defining objectives regarding where you want to be in the next year.

Whether you are a new customer or a long-time user of our software: We have plans with you!

MAGMAsupport

MAGMAsupport stands for the competent, methodical and fast support of our customers worldwide regarding all questions in the application of and problem-solving with our products. With the MAGMA APPROACH, our qualified support staff will help you to make better use of our software every day.

MAGMAacademy

The MAGMAacademy systematically supports you in the implementation of both casting process and virtual optimization, from the initial rollout to the comprehensive application of Autonomous Engineering throughout the entire organization.

In our training courses, workshops and seminars, we convey interdisciplinary understanding across all processes and departments for the best possible use of MAGMASOFT® - conducted at our offices or through a customized solution on-site.

MAGMAengineering

As an independent and competent partner, MAGMAengineering supports a successful virtual product development, tooling design and optimization of your robust foundry processes within the framework of engineering projects.

An interdisciplinary and international team of experts, with numerous years of casting expertise, is available to work with you using MAGMASOFT® autonomous engineering to address your challenges.

Casting Knowledge. In a Software.

MAGMASOFT ® 6.0
